

Sewer Maintenance Challenges

The WMUA has two ongoing sewer maintenance challenges. The build-up of fats, oil and grease in the sewer lines, and “flushable wipes”. These materials disrupt sewer service by creating sewer line blockages. In an effort to keep your own lines clear, please do not dispose of grease by flushing it down your toilet or pouring it down your drains. Instead, pour grease into containers (old coffee cans) place it in your freezer and dispose of it with your trash. Consider placing the flushable wipes in your trash as well as they do not disintegrate and tend to get wrapped around everything in the sewer line.
